#### Generalized Method of Moments (GMM)

Developed by Hansen (1982) to estimate model parameter θ based on a sample z<sub>1</sub>,..., z<sub>n</sub> through a potentially overidentified system of (sample) moment conditions
 <sup>1</sup>/<sub>n</sub> Σ<sup>n</sup><sub>i=1</sub> m(z<sub>i</sub>, θ) = 0

• Example:  $\frac{1}{n} \sum_{i=1}^{n} \mathbf{x}_i (y_i - \mathbf{x}_i \boldsymbol{\theta}) = 0$  for simple linear regression

• The estimation is done by minimizing a quadratic form  $\hat{Q}_n(\theta) = (\frac{1}{n} \sum_{i=1}^n \mathbf{m}(\mathbf{z}_i, \theta))^T \hat{\mathbf{W}}(\frac{1}{n} \sum_{i=1}^n \mathbf{m}(\mathbf{z}_i, \theta))$ , where  $\hat{\mathbf{W}}$  is a weighting matrix

Introduction GMM and IP Contribution Co

#### Robustness of External Information

- The validity of the GMM depends on the correct specification of the moment conditions ⇒ the external information must be point accurate
- In practice, the external information itself is based on data or expert opinion, so as a point it is almost certainly misspecified

Institute of Psychology Universität Hamburg Germany

(ロ) (四) (注) (注) (注)

Testing the Coherence of Data and External Intervals via an Imprecise Sargan-Hansen Test

### Robustness of External Information

- The validity of the GMM depends on the correct specification of the moment conditions  $\Rightarrow$  the external information must be point accurate
- In practice, the external information itself is based on data or expert opinion, so as a point it is almost certainly misspecified
- Main Idea (Part 2): Use intervals instead of points for the external information

 $\Rightarrow$  This naturally leads to an imprecise probability situation, via coarse data completion (Augustin et al., 2014)

#### But Even Intervals Can Be Wrong!

 Objective for ISIPTA paper: Develop an overall test for coherence of data and external intervals, given the model

Institute of Psychology Universität Hamburg Germany

Testing the Coherence of Data and External Intervals via an Imprecise Sargan-Hansen Test

Introduction GMM and IP Contribution Cont

#### But Even Intervals Can Be Wrong!

- Objective for ISIPTA paper: Develop an overall test for coherence of data and external intervals, given the model
- The GMM framework includes a test that can serve this purpose: the Sargan-Hansen test (based on  $n\hat{Q}_n(\hat{\theta}) \stackrel{d}{\rightarrow} \chi_r^2$ )

Institute of Psychology Universität Hamburg Germany

Testing the Coherence of Data and External Intervals via an Imprecise Sargan-Hansen Test

#### But Even Intervals Can Be Wrong!

- Objective for ISIPTA paper: Develop an overall test for coherence of data and external intervals, given the model
- The GMM framework includes a test that can serve this purpose: the Sargan-Hansen test (based on  $n\hat{Q}_n(\hat{\theta}) \stackrel{d}{\rightarrow} \chi_r^2$ )
- The Sargan-Hansen test is a test for overidentifying moment conditions that shows "how far" the system is away from being identified

#### The Sargan-Hansen Test Based on external intervals

Let  $\mathbf{e}_0$  be the true value of the external moments and  $\mathbf{I}_{ex}$  be the external interval.

Desired property of a coherence test: Test decides that  $\mathbf{e}_0 \notin \mathbf{I}_{ex} \Rightarrow$  Test decides that  $\mathbf{e}_0 \notin \mathbf{I}$  for all  $\mathbf{I} \subset \mathbf{I}_{ex}$

# $\Gamma$ -Maximin decision rule for selecting a p-value

- Cautious data completion leads to test statistic interval  $[\underline{Q}, \overline{Q}]$
- Possbile asymptotic distributions (credal set!):  $\chi^2(\lambda)$ -distributions with noncentrality parameter  $\lambda \in [0, \infty)$
- $p_{\mathbf{e}} = P_{\chi^2_{p_2}(\lambda)}(\{Q > Q_{\mathbf{e}}\})$  are increasing in  $\lambda$  for every  $Q_{\mathbf{e}} \in [\underline{Q}, \overline{Q}]$  (stochastic order)  $\Rightarrow$  lower probability is reached at the  $\chi^2(0)$ -distribution

Testing the Coherence of Data and External Intervals via an Imprecise Sargan-Hansen Test

# $\Gamma$ -Maximin decision rule for selecting a p-value

- Cautious data completion leads to test statistic interval  $[\underline{Q}, \overline{Q}]$
- Possbile asymptotic distributions (credal set!):  $\chi^2(\lambda)$ -distributions with noncentrality parameter  $\lambda \in [0, \infty)$
- $p_{\mathbf{e}} = P_{\chi^2_{p_2}(\lambda)}(\{Q > Q_{\mathbf{e}}\})$  are increasing in  $\lambda$  for every  $Q_{\mathbf{e}} \in [\underline{Q}, \overline{Q}]$  (stochastic order)
  - $\Rightarrow$  lower probability is reached at the  $\chi^2(0)-{\rm distribution}$
- maximal lower probality is reached at the event {Q > Q} (monotonicity)
  - $\Rightarrow P_{\chi^2_{p_2}}(\{Q>\underline{Q}\})$  is the p-value for the imprecise Sargan-Hansen test

Martin Jann

# Outlook

The test construction is mainly based on the stochastic ordering of the distribution family underlying the test statistic.

 $\Rightarrow$  The arguments can be generalized to many statistical tests used in psychology and econometrics, e.g., the Wald test for general linear and nonlinear hypotheses, the likelihood ratio test as well as the Langrange multiplier test.
