

MULTI-LAYER BELIEF MODEL

CONNECTING DEMPSTER-SHAFER THEORY AND THE TOPOLOGY OF EVIDENCE

INPUT

Total set: ●●●●●
 Pieces of evidence (●●●, p1)
 + : (●●●, p2)
 Certainty degree (●●●, p3)

LAYER I

Selection of justifications

LAYER II

Combination of values

LAYER III

Mapping of combined values and justifications

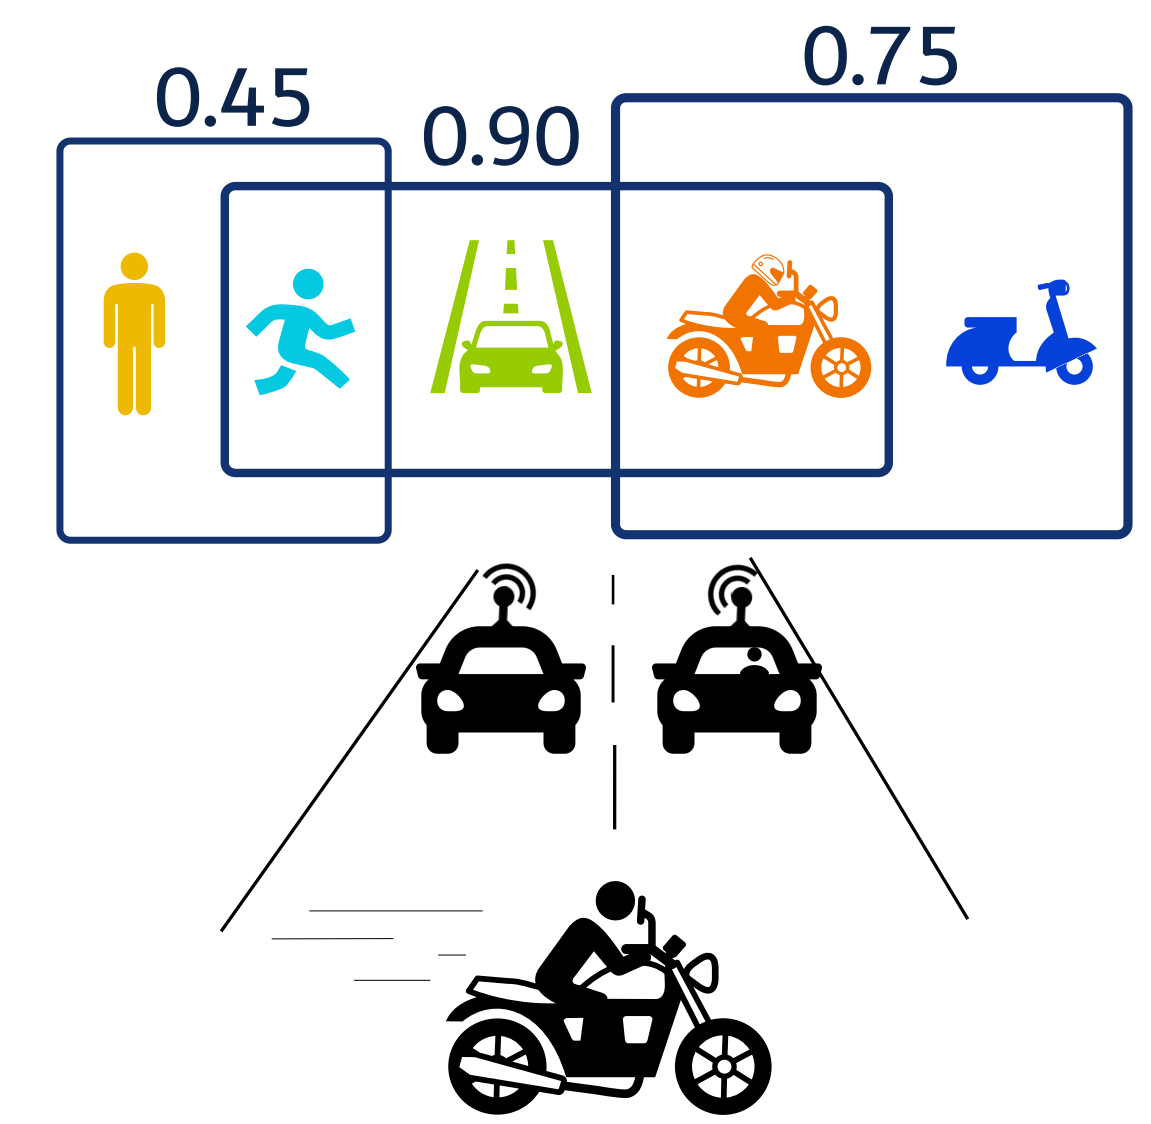

OUTPUT

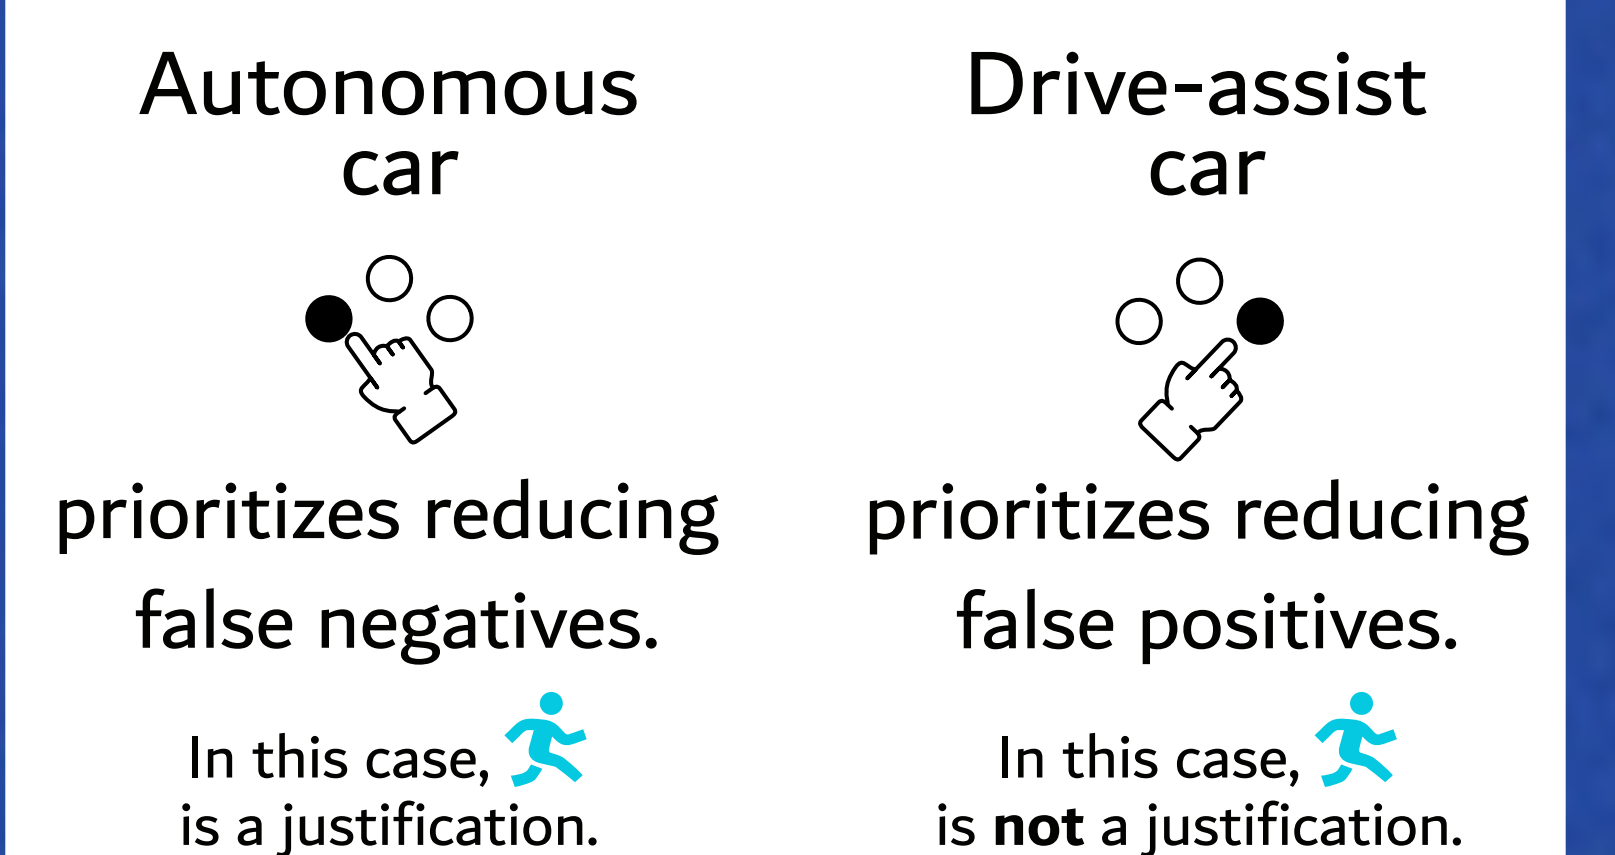

Degree of belief for ●●●●●
 = combined value of ●●●●●

EXAMPLE

INPUT + SITUATION

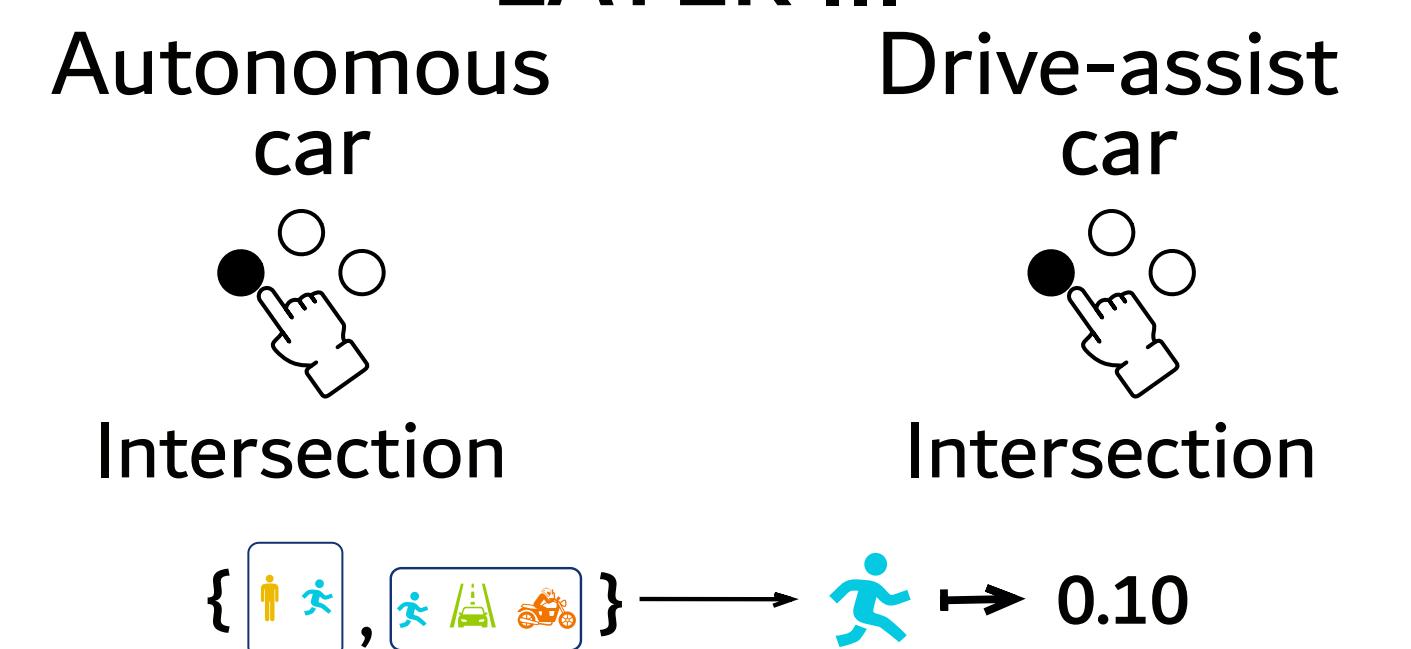

LAYER I

LAYER II

LAYER III

OUTPUT

The autonomous car believes the object is a person (●●●) with degree 0.16.
 The drive-assist car does not believe the object is a person (●●●).

A NEW MODEL TO MERGE UNCERTAIN EVIDENCE AND COMPUTE JUSTIFIED BELIEF

If you are conducting data experiments with potentially contradictory, incomplete, and uncertain pieces of evidence, we invite you to explore our belief model for a potential solution. It will also enable you to leverage this evidence across different contexts.
